Overview

Customer Service allows AIMS3 to automatically communicate with requesters throughout the life cycle of a Work Order. Since most organizations do not have the staff available to manually update requesters every time a Work Order Status changes, Customer Service helps keep users informed through automated messages.

While AIMS3 includes an Automation component, Customer Service provides additional flexibility and customization for requester communications.
Because AIMS3 can send different messages based on the Work Order Type, Work Order Status, and Service Department, organizations are encouraged to personalize their messages to provide the most meaningful updates to requesters.

All Customer Service tabs include the following controls in the upper-left corner for all tabs:

- Save
- Add New
- Duplicate
- Delete
- Undo

Note: System Administrators, or users with the appropriate Security Level, can create and manage Customer Service settings. While these settings are designed to improve communication with requesters, organizations may choose to use them in diverse ways to support their workflows. It is recommended that Customer Service settings be reviewed regularly to ensure messages remain accurate, helpful, and aligned with organizational goals.

If you need assistance creating, updating, or deleting Customer Service settings, Phoenix Data Systems offers consulting services to help organizations maximize the use of Customer Service within AIMS3.

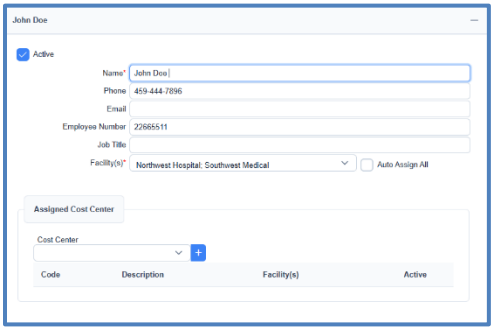

CLASSIFICATION: FOR PUBLIC USE

Address Book

The Address Book allows organizations to maintain a list of requesters and points of contact for Facilities and Cost Centers. This provides a central location for contact information and helps ensure communication is directed to the appropriate person or group.

When creating a Work Order, users can select a requester from the Address Book instead of manually entering contact information. As soon as a requester is selected, their phone number and email address automatically populate, saving time and improving data accuracy.

To create a new Address Book entry, click the New and complete the following fields:

Name: Enter the full name of the requester or point of contact. For consistency, all names should follow the same format, such as Last Name, First Name or First Name Last Name. Consistent formatting helps improve searching, reporting, and communication.

Phone: Enter the phone number for the requester, point of contact, or a central number for the Cost Center. This field is formatted for a standard 10-digit phone number.

Email: Enter the email address for the requester, point of contact, or a shared Cost Center email address. This field validates email formatting and will not allow the record to be saved if an invalid email address is entered.

Employee Number: Enter the employee number associated with the contact.

Job Title: Enter the contact's job title.

Facility(s): Select the Facility or Facilities where the contact is associated. Use the provided checkbox to quickly assign all Facilities if needed.

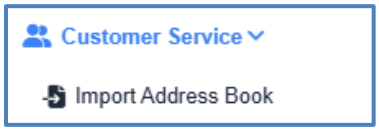

Cost Center: After a Facility has been selected¸ After selecting a Facility, assign one or more Cost Centers using the grid provided. Multiple Cost Centers can be associated with a single contact record.

CLASSIFICATION: FOR PUBLIC USE

Import Address Book

For larger organizations, manually entering each Address Book record can be time-consuming. To simplify the process, AIMS3 provides an Import Address Book feature that allows multiple contacts to be added at once.

This option is available as a submenu under Customer Service. Organizations can import a list of contacts using the required Address Book fields:

- Name
- Phone
- Email
- Employee
- Job Title

During the import process, these fields are mapped on the Import Address Book page to ensure the data is placed in the correct fields.

Note: Facility information is not included in the import file. The Facility must be selected on the Import Address Book page before the import is processed. For this reason, all records included in a single import should belong to the same Facility or Facilities.

The following options are available during the import process:

Overwrite Only Existing Entries: Updates records that already exist in the Address Book. New records are not affected.

Overwrite All Entries: Replaces all existing Address Book records with the imported data. Any records not included in the import file will be removed from the system.

Note: Use the Overwrite All Entries option with caution, as it will replace the current Address Book data.

Forms

Forms allow organizations to create customized email messages for communicating with requesters and Customer Service contacts throughout the Work Order process. While creating and maintaining these messages requires some initial setup, it is typically only needed during implementation or when updates to messaging are required. Taking the time to create clear and informative messages helps improve communication and keeps requesters informed.

Some common Forms organizations may choose to create include:

- **Confirmation Email**: Sent as Work Orders are submitted from EasyNet.
- **Completed Email:** Sent as Work Orders are completed by Technicians.
- **Cancelled Email:** Sent as Work Orders are canceled.

Each Form must have a unique Form Name that clearly describes its purpose. If your organization uses similar Forms for different Work Order Types, consider including the Work Order Type in the name. For example, Confirmation Email (Project) or Completed Email (Maintenance). This makes Forms easier to identify and manage.

Within the Form Design section, Administrators create the content and layout of the email. The Top of Email should include a greeting and a brief introduction explaining why the message was sent. Emails should be written in a friendly, professional tone and appear as though they are coming from a person rather than an automated system.

For example:
Dear Customer,
Thank you for your request. Below is the information you submitted. Please retain this information for future reference.

CLASSIFICATION: FOR PUBLIC USE

This type of introduction acknowledges the recipient, provides good customer service, and explains the purpose of the email.

After the introduction, Administrators can select which record fields will be included in the email. Up to ten fields can be displayed. Organizations should determine which fields provide the most value based on the purpose of the message. For example, a Confirmation Email may include request details and submission information, while a Completed Email may focus on completion details and technician comments. Since the Work Order Number is already included in the email subject line, it may not need to be displayed within the email body.

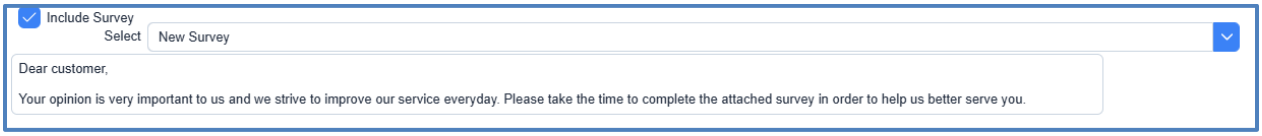

The Bottom of Email should include any additional information, expectations, and a closing message.

For example:
Please note that requests are completed based on priority and the date submitted. You will receive additional updates as work progresses. You may also return to the request page at any time to view the status of your request.

Thank you,
Your Facilities Team

A professionally written closing helps set expectations, provides helpful information, and creates more personal experience for the requester. Most importantly, it helps the email feel like it was sent by a person rather than a computer.

Administrators can also include a Survey Link below the Bottom of the Email section. Surveys are a valuable way to collect feedback and measure customer satisfaction. Survey links are typically best used in Completed or Cancelled Work Order emails and should not be included in Work Orders that do not have a requester assigned.

After a Form has been created and saved, it will appear in the Existing Forms grid at the bottom of the page.

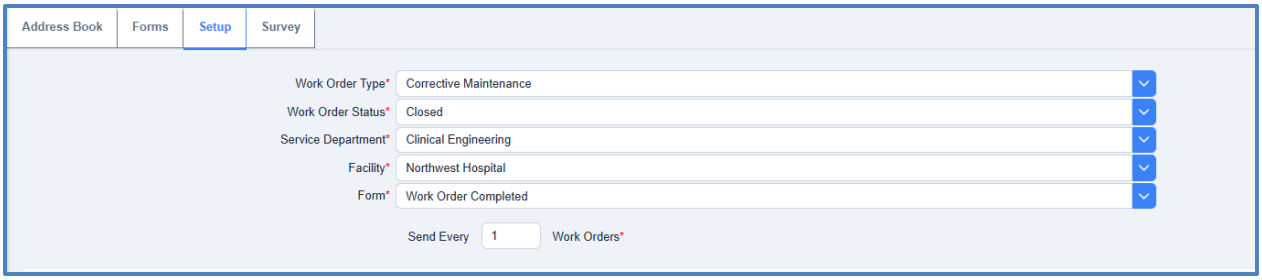

CLASSIFICATION: FOR PUBLIC USE

Setup

Setup determines when a Customer Service Form is sent. Each setup record is configured using a combination of the following criteria:

- Work Order Type
- Work Order Status
- Service Department

After these are declared, Administrators choose the appropriate Form. Forms can be reused.

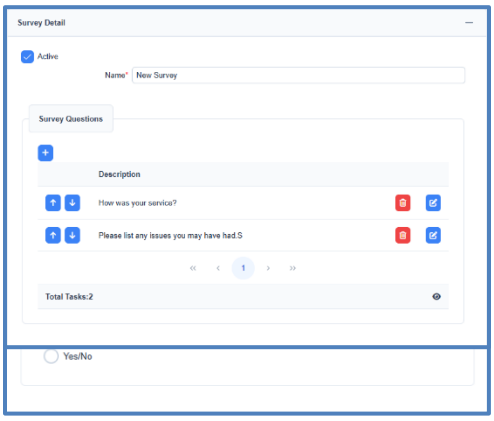

After these settings are declared and saved, the system will begin sending emails to the proper recipients.

CLASSIFICATION: FOR PUBLIC USE

Survey

The Survey component allows Administrators to create customer satisfaction surveys that can be included in Customer Service Forms. Like Forms, AIMS3 supports multiple Surveys, allowing organizations to collect feedback on various aspects of their services. Administrators familiar with creating Tasks and Procedures will find the Survey setup process similar. A checkbox at the top of the screen allows a Survey to be activated or deactivated. Each Survey must have a unique name so it can be easily identified and assigned to the appropriate Form.

After entering a Survey Name, Administrators must create at least one Survey Question. Questions are added by clicking the New button in the Survey Questions grid. This opens the Question setup window, where the Administrator selects the type of question and configures its settings. Each question can be marked as either Required or Optional. Administrators should carefully consider which questions should require a response. For example, an open-ended comment field used for additional feedback will often be optional, while rating or scoring questions used to measure customer satisfaction typically be required.

AIMS3 provides six different question types, allowing organizations to build surveys that gather meaningful and actionable feedback from requesters. The six types of Questions are:

Ranked: This allows users to select a rating between 0 and 5.
Example question: Using a scale of 0-5 (5 being most positive), how would you rate the Technician?

Value: This allows users to select an option between a range.
Example question: How many hours did it take for the Technician to respond to your issue?

Text: This allows the user to have a text box to offer free form text.
Example question: Please offer any other thoughts regarding the service provided.

No Response: Allows administrators to put text throughout the Survey.

Numeric: Allows the user to enter a number as needed.
Example question: How many callbacks were required to complete this service to your satisfaction?

Yes/No: Allows for a simple Yes/No question.
Example question: Was the service completed to your satisfaction?

CLASSIFICATION: FOR PUBLIC USE

Conclusion

Providing great customer service can be challenging while managing daily responsibilities and maintaining a busy workload. Automated communication helps bridge that gap by keeping requesters informed without requiring additional manual effort from staff.

The Customer Service component in AIMS3 is designed to streamline communication throughout the Work Order lifecycle. Through automated emails and customer satisfaction surveys, organizations can keep requesters informed, gather valuable feedback, and improve the overall customer experience.

When properly configured, Customer Service helps ensure consistent communication, reduces the need for manual follow-up, and enhances the perception of the Facilities Department among its internal customers. By keeping requesters updated on the status of their Work Orders and providing opportunities for feedback, organizations can strengthen trust and improve customer satisfaction.

If you need assistance configuring the Customer Service component, creating Forms, or designing Surveys, Phoenix Data Systems offers consulting services to help organizations maximize the value of their AIMS3 system.
