CLASSIFICATION: FOR PUBLIC USE

Overview

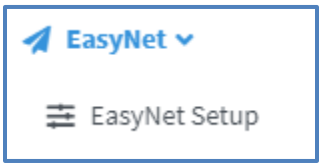

EasyNet is a valuable tool that saves time and human effort to manage requests from external customers of a Service Department. Many organizations cannot complete all the assigned tasks while also manning a call center to receive orders and report statuses on previous requests.

EasyNet provides the platform to receive these requests and give requesters the ability to check on requests themselves. This allows members of the Service Department to focus on completed tasks. Components such as EasyNet and Customer Service allow Administrators to use automated systems and provide superior customer service at the same time. Administrators should always look for various ways to better the perception of the Service Department any chance they can get.

EasyNet and EasyNet Setup are located on the menu after System Setup and before Reports.

CLASSIFICATION: FOR PUBLIC USE

EasyNet Page

Upon clicking the EasyNet Component in the menu bar, the right panel will display the current configuration of the EasyNet page. While Work Orders can be entered through this screen, the purpose of the page is to show how the finished page will appear to the user. The EasyNet Setup submenu item will also appear under the EasyNet menu item.

The EasyNet page consists of three main sections:

- Header
- Work Order Page
- Footer

Header

The top of the screen includes the Submit and Clear buttons as well as the Header. The Header can be customized under EasyNet setup. The Header can be customized to include logos and pictures, instructions, and hyperlinks. The Header's purpose is to welcome users to the page and offer additional guidance.

Work Order Page

The Work Order Page contains three tabs:

- Work Order Request
- Work Order Lookup
- Equipment Lookup

It is important to remember all three tabs are available to all users unless Permissions are set up. To remove one or more tabs, reference the EasyNet Setup section for more guidance.

Work Order Request

The Work Order Request tab contains how the EasyNet page is currently configured. It shows Field sets and their fields and which fields are required. Some Organizations may wish to reorder Field sets to make the "flow" of the page more user-friendly. In addition, Field sets can be added to or removed from the form through EasyNet Setup->Customize Fields.

Administrators can insert custom Tooltips and instructions. When assessing an EasyNet page, it is important to click in and out of every field to view all customizations.

Footer

The Footer is located at the bottom of the page and works exactly like the Header. The Footer can be customized under EasyNet setup. The Footer can be customized to include

CLASSIFICATION: FOR PUBLIC USE

logos and pictures, instructions, and hyperlinks. The purpose of the Footer is to offer additional guidance.

Work Order Lookup

Work Order Lookup permits requesters the ability to look up their Work Orders and view their Status. The grid contains powerful filters so users can locate their Work Orders quickly. In addition, there are buttons at the top of the grid so users can refresh the grid, Select Columns, and Export the list. Underneath the Select Columns and Export buttons is a global search field.

Each column allows users to sort ascending or descending by clicking the column header. Underneath the column header is a search function. Clicking the filter button (located only in columns which contain String values) allows the user to select a "Contains" argument or no filter.

Note: Work Orders cannot be edited from this screen!

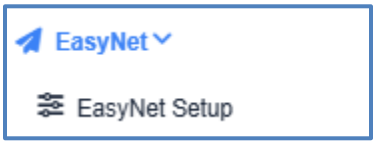

Equipment Lookup

The Equipment Lookup tab displays all Equipment in the database. The grid contains powerful filters so users can locate their Equipment quickly. In addition, there are buttons at the top of the grid so users can refresh the grid, Select Columns, and Export the list. Underneath the Select Columns and Export buttons is a global search field.

Each column allows users to sort ascending or descending by clicking the column header. Underneath the column header is a search function. Clicking the filter button (located only in columns which contain String values) allows the user to select a "Contains" argument or no filter.

CLASSIFICATION: FOR PUBLIC USE

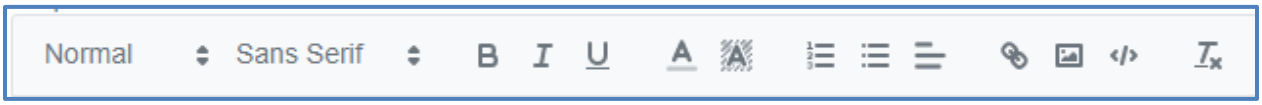

EasyNet Setup

EasyNet can be customized to meet an organization's needs. Instructions can be added in several places on the EasyNet page and as a field's Tooltip. Required fields can be set and defaults can be programmed to ensure complete and accurate information is entered. Just as with other sections of AIMS 3, these settings should be reviewed regularly to ensure the page is working best for the Administrators.

After clicking the Easynet submenu, a page with a dropdown field will appear on the main portion of the page. While there are many options available to customize the EasyNet page, it is unlikely Administrators will use every option.

Announcements – Here, Administrators can set the Header, Footer, Location instructions, and Tooltips. The Header is located at the top of the page, the Footer at the bottom of the page, and the Location Announcement is located inside the Location Field set. Each Announcement contains an editor box the Administrator can use to format instructions, a logo, and other items using the tools provided:

Font Size – Users can select Normal (smallest), Subheading (bigger), and Heading (biggest).

Font – Users can select three different fonts: Sans Serif, Serif, and Monospace.

Font Format – Users can select Bold, Italicize, Underline, Font Color, and Font Background.

Additional Tools – Users can create numbered and unnumbered lists, change text alignment, insert a link, insert a photo, and raw HTML.

Note: Do not forget to click save after creating/changing Announcements before reviewing the EasyNet page!

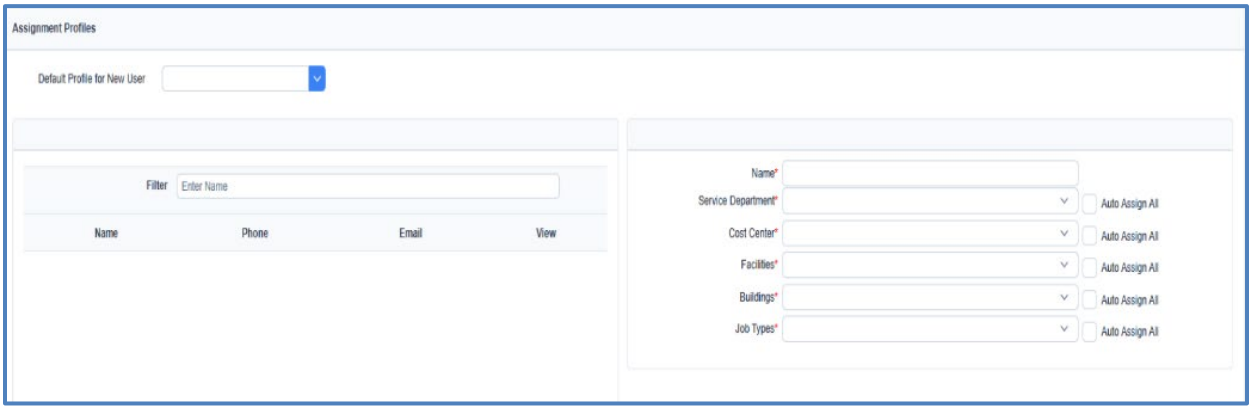

In addition to the Announcements, Administrators can add Tooltips to certain fields. Tooltips are bubbles that appear when a user clicks in or hovers over a field. These are called Field-Level Announcements. Clicking the pencil next to a field will enable the user to enter text for the Tooltip. For HTML-savvy users, HTML can be used to make the Tooltip dynamic. This includes changing font size and color, scrolling, and adding lists.

CLASSIFICATION: FOR PUBLIC USE

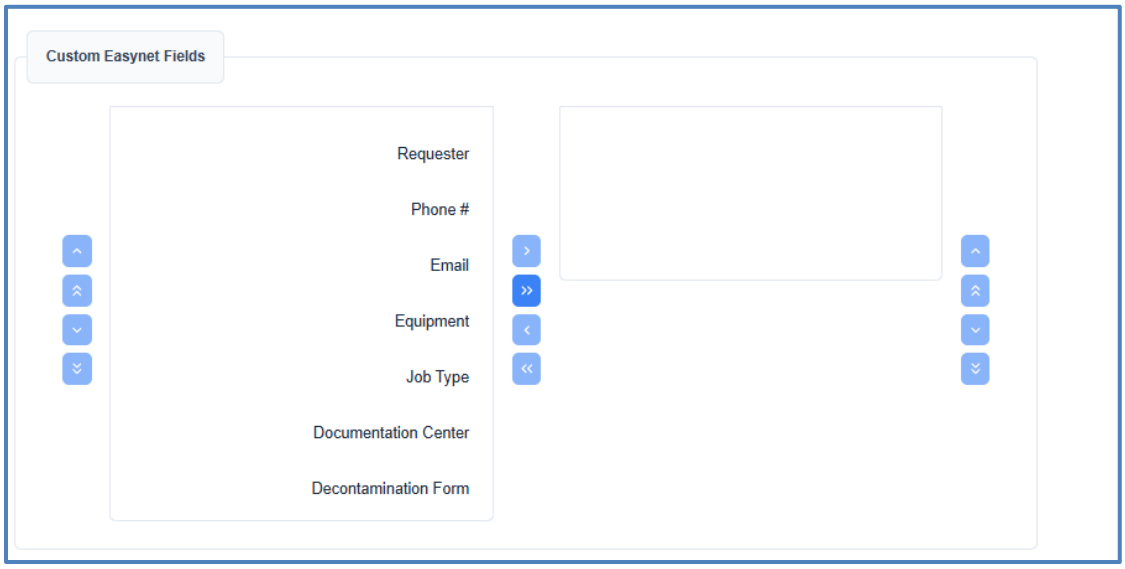

Assignment Profiles – If an organization will require users to log into the EasyNet page, it is recommended to create Assignment Profiles for the users, much like Assignment Profiles in the main program. This allows Administrators to restrict users to:

- Service Department
- Cost Center
- Facilities
- Building

To add an Assignment Profile, the user clicks on the New button in the toolbar. The only required field is Name. After that, the user selects which data for the Assignment Profile and clicks Save.

Customize Fields – Fields are added and removed using the grid provided. The selectors in this section work like anywhere else in the program. Fields added to the right side of the grid will be shown on the Easynet page while fields in the left side of the grid will be removed and will remain "Available."

CLASSIFICATION: FOR PUBLIC USE

Data Managers – Administrators can restrict which Data Managers the EasyNet users can see and use. From the dropdown list, Administrators choose the Data Manager to restrict. The Unassigned Data Managers will be on the left side of the grid and Assigned Data Managers will be on the right side. The controls in this grid work as they do elsewhere in the program.

Note: The user must click save before navigating away from this page! Simply moving the Data Manager to another grid does not save it!

Other Settings – In this section, Administrators can affect how general EasyNet options will affect the usability of the page. This includes:

Home Screen EasyNet Queue Options – This section refers to the EasyNet Queue widget on the Home Screen.

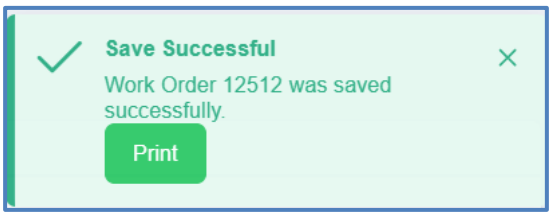

Remove Work Order from EasyNet Queue when Viewed – When this is selected, a Work Order is removed from the queue by simply being clicked. With this option, if the Work Order is not assigned it can get "lost." It will, however, show on the Unassigned Work Order Log.

Remove Work Order from EasyNet Queue when Viewed and Assigned – When this is selected, a Work Order is removed from the queue after being Assigned and/or Saved.

Prompt on Other Open Work Orders – This will prompt the requester with a popup informing them other open Work Orders for the current Equipment exists. This is to avoid duplicating Work Orders.

Enable quick search on Tag Number – This will allow the user to search by both Tag and Serial Number. The Equipment will show in a list and must be selected from the list.

Print Work Order from EasyNet – This allows the requester to print their Work Order from the EasyNet page on the confirmation toast message in the upper right corner.

Enable Work Order Lookup – This will turn on/off the Work Order Lookup globally.

Enable Equipment Lookup – This will turn on/off the Equipment Lookup globally.

View PM Information from EasyNet Equipment Location – This will allow end users to see any PM information regarding the Equipment they are selecting.

Override Equipment Cost Center with User Default – When an end user puts in a tag number, the Default Cost Center will override the Cost Center found in the AIMS 3 system.

CLASSIFICATION: FOR PUBLIC USE

Required Fields – In this section, Administrators can set required fields on the EasyNet page. The only required fields are Problem and Facility. There are others which are commonly required, such as Requester, Phone, and Email. Clicking the checkbox on the left of the field will require the field on the EasyNet page.

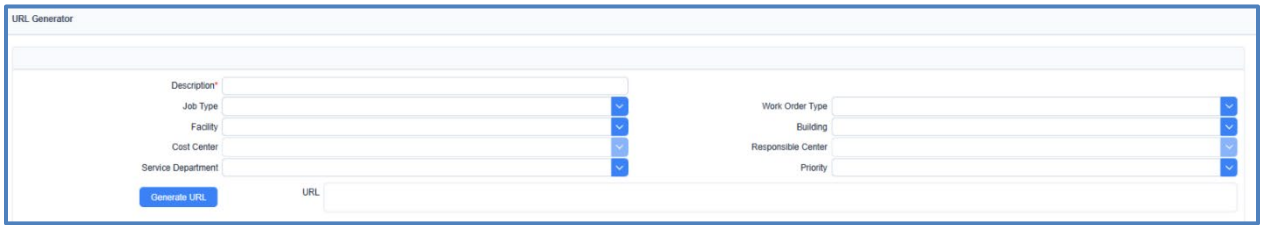

Note: Requiring fields in the main program does not make them required on the EasyNet page and vice versa!

It is recommended to battleplan requiring fields. To help with ensuring accuracy, many organizations require Tag Number. This makes sense. It completes many of the fields and helps technicians locate the Equipment. However, what happens when a requester needs to enter a Work Order which is not Equipment-based? Some organizations have made a "miscellaneous equipment" record in the system and have added instructions to state Work Orders which do not require Equipment should be entered with the Tag Number "MISC." However, this poses two issues:

- There is now an Equipment record in the system, but it is a phantom record and will show on reports.
- Requesters will begin entering all Work Orders with the Tag Number of "MISC," since it is easier than looking for the correct Tag Number.

Therefore, Administrators must evaluate which method is more tolerable, not requiring a Tag Number or risk everything being entered as "MISC."

URL Generator – The URL Generator allows Administrators to set up multiple EasyNet "pages." Using the fields provided, users must enter a Name for the page and then set the various defaults desired.

Clicking "Generate URL" or saving the record will create the custom URL for the page. This URL should be sent to the organization's IT department to deploy to the Service Department's landing page. The current list of URLs is listed below the generator and contain a Delete, Edit, and Copy to Clipboard buttons.

Note: Changing ANY defaults will change the URL! Users should send the updated URL to their IT department to ensure the correct page is available!

CLASSIFICATION: FOR PUBLIC USE

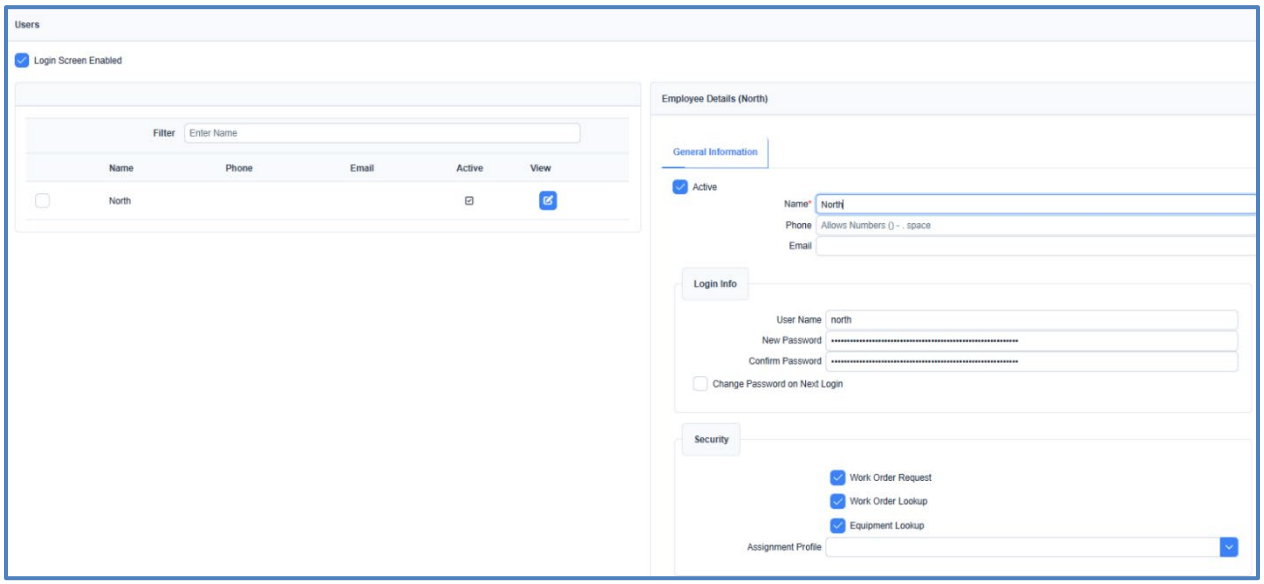

Users – If an organization requires users to log in, their user records can be added here. The only required field is Name, but the following records can be added:

- Phone
- Email
- Username
- New Password
- Confirm Password
- Change Password on Next Login

In addition to this, Administrators can restrict access individually to:

- Work Order Request
- Work Order Lookup
- Equipment Lookup

At the top of the screen, the checkbox Login Screen Enabled must be checked to utilize users. Once this is checked, it affects all pages.

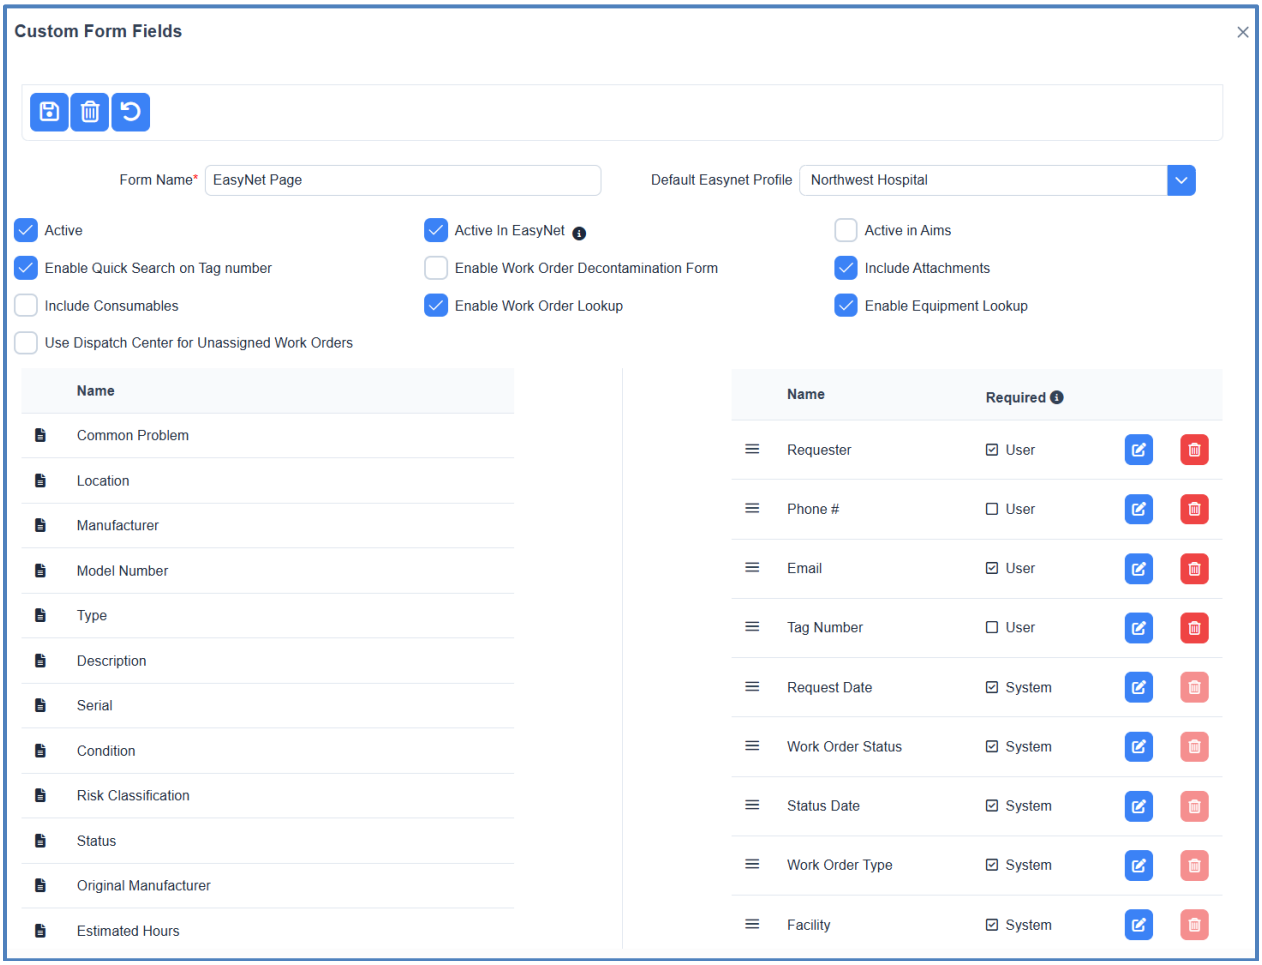

CLASSIFICATION: FOR PUBLIC USE

Custom EasyNet Work Order Forms

Custom EasyNet forms can be created to meet an organization's, Facility's, or Service Department's needs. In System Setup->Customize Work Order Forms, Administrators can create Easynet pages with the fields they want, enter default values to fields, and hide fields from the end user. This function does not exclusively create EasyNet pages; it also creates Work Order forms to be used within the Work Order component. These pages can be suppressed from certain user's view by using Data Managers->Assignment Profiles. This functionality does not replace the URL Generator. It is simply a different way to create custom pages.

After clicking the "New" button in the toolbar, the user will be presented with a popup to design the new custom Work Order form. On this form is an abbreviated toolbar with the "Save," "Delete," and "Undo" buttons.

The Form Name is required and must be unique. Directly below this field are multiple checkboxes:

CLASSIFICATION: FOR PUBLIC USE

- **Active –** Allows the form to be seen and used.
- **Active in Easynet –** Allows the form to be used as an EasyNet page.
- **Active in AIMS –** Allows the form to be used in the Work Order Component
- **Enable Quick Search on Tag –** Allows users to use the find tool when searching for Equipment
- **Enable Work Order Decontamination Form –** Allows users to add the decontamination form
- **Include Attachments –** Allows the end user to add attachments to the form.
- **Include Consumables –** Allows the end user to add consumables to the form.
- **Enable Work Order Look Up –** will allow end users the ability to search for Work Orders.
- **Endable Equipment Look Up –** Will allow end users the ability to search for Equipment.
- **Use Dispatch Center for Unassigned Work Orders –** This will move any unassigned Work Orders to the Dispatch Center to allow Dispatchers the ability to assign Work Orders made in EasyNet.

Note: In order for Work Orders to go to the Dispatch Center, you must have Dispatching available inside of AIMS 3.

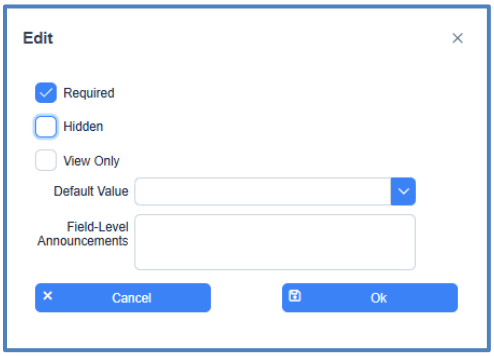

The list of fields on the left side of the divider line are the fields available to be used on the form but are not selected. This list of fields on the right side of the divider line are required fields. This includes both system-required fields and fields required by Administrators through System Setup->Required Fields. These fields contain a checkbox to denote whether the field is required or not, an “Edit” button, and a “Delete” button. Administrators can move fields from the left side of the divider line to the right to make them available on the form. Some “fields” may hold more than one field. For example, using the “Location” field will activate all location fields:

- Building
- Wing
- Floor
- Room
- Location
- Spot
- Free Text Location
- As Of Date

The fields which are not needed can be removed.

Note: Only fields not marked as required can be removed from the right side of the divider line!

CLASSIFICATION: FOR PUBLIC USE

To customize a field, the Administrator must click the "Edit" button to the right of the field name. The Administrator will be presented with an "Edit" popup:

The Required checkbox allows the Administrator to declare the field as required or not required on the form. System-required fields cannot be unchecked.

The Hidden checkbox allows the Administrator to hide the field on the form. If the field is to be hidden, a default value must be entered. The only exception is for date fields,

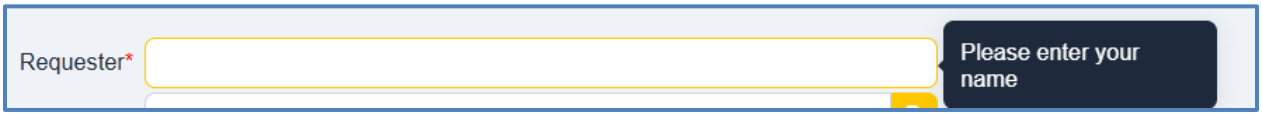

The View Only checkbox will show the field on the page, but the data will not be editable by the end user.

The Default Value field allows Administrators to have data prepopulated in the field. Some examples are:

- Work Order Type
- Work Order Status
- Priority
- Facility
- Service Department

This functionality is used often with the Hidden and View Only checkboxes.

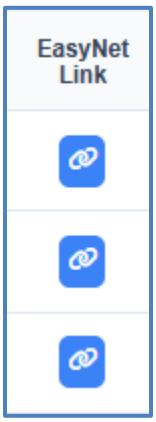

Field Level Announcements allow the Administrator to show instructions with the end user clicks into a field. For example, an announcement can request a full name or an official email. This field does accept HTML commands to highlight certain announcements.

Administrators can rearrange the fields by using the three lines on the left side of each field. It is important to arrange fields in a logical order to help with the ease of use of the form.

CLASSIFICATION: FOR PUBLIC USE

After the form is complete and the Active in EasyNet checkbox is checked, a "Copy URL" button will be visible in the list of custom forms in the "EasyNet Link" column. Clicking this button will copy the URL to the computer's clipboard. This can be pasted anywhere to disseminate the address accordingly.

CLASSIFICATION: FOR PUBLIC USE

Conclusion

EasyNet is a great way to allow users outside of AIMS3 to submit Work Orders. Because of this, Service Departments can operate without the constant interruption for taking "orders." A well-set-up page can offer accuracy and prevent duplicate Work Orders. Through this, it is a great way for Service Departments to deliver excellent customer service without any extra effort.

If Administrators require additional consulting or training, Phoenix Data Systems is available to assist at any level. Please contact our Sales Department or Project Managers for more information.
