Overview

There are times organizations need to view their data in ways AIMS 3 cannot provide. This can be through external productivity applications or simply having the need to send the information through a familiar file type, such as a Comma Separated Value file. Regardless of the need, AIMS 3 makes it easy to export all or a subset of data from the database.

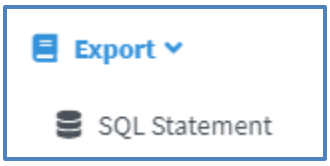

Using the same filter mechanism from the List Views found elsewhere in the system, Export will appear familiar. In fact, Export is found in the same List Views mentioned, and the needed data could be obtained without using the Export feature.

Where Export separates itself from the List Views is having the ability to write custom SQL scripts to use advanced SQL commands. These commands include but are not limited to, SUM, AVG, and COUNT.

In the end, users will find it easy to export the data they need in a timely manner and in the format needed.

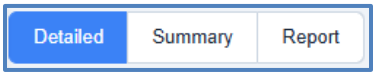

Export

Upon clicking the Export Component in the menu bar, the right panel will display the Export configuration screen. The SQL Statement submenu item will also appear.

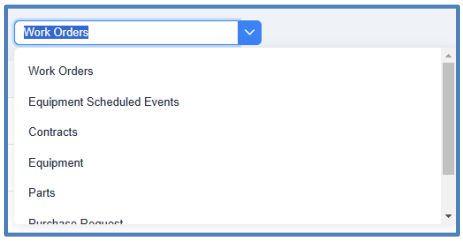

Header

At the top of the screen in a grey section which includes useful tools to set up how which data to Export. Just below the Breadcrumbs is a checkbox to "Include Totals" in the file after it downloads. "Include Totals" will show Just beneath that are three Report Style buttons:

- Detailed – Gives all data and its values. If a Work Order contains more than one cost, such as Labor, the Work Order will appear for each individual cost.
- Summary – Summary format will auto sum the hours, quantities, and cost for labor/material.
- Report – Will export the data in a format which groups costs and gives a total for each, such as Labor and Materials.

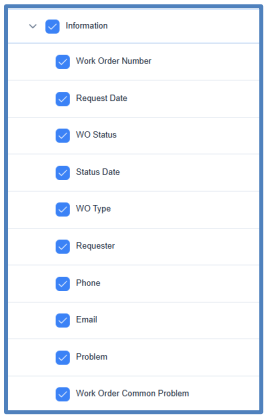

To the right of the Report Style buttons is a dropdown to declare from which Component the data will be retrieved. Currently, there are multiple Components to choose from:

- Contracts
- Equipment
- Equipment Scheduled Events
- Work Orders
- Parts
- Purchase Request
- Purchase Order

CLASSIFICATION: FOR PUBLIC USE

Selecting Fields

Fields are grouped according to the Field set they originally appear in the Component. In addition, they are organized by the order they appear in the Field.

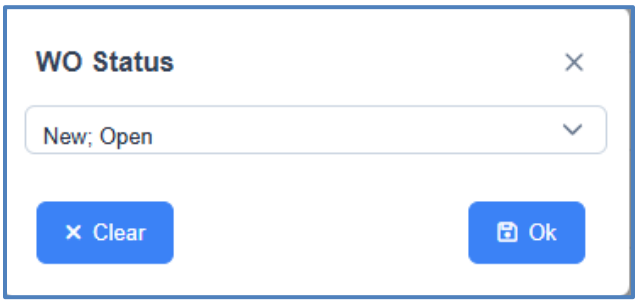

Note: Fields can be copied to the Header of the Component. In Export, they will only appear in the field set in which they originally appear!

All fields for a Component are listed underneath the header. To include a field in the Export, users must click the accompanying checkbox next to the field's name. To include or omit all fields of a field set, users may click or unclick the checkbox next to the Field set's name. To include all fields of a Component, users can click the checkbox next to the Component's name at the top of the list of fields.

Filtering Data

To limit which data is included in the Export, users can filter the data using the Filter button  on the right side of the corresponding field. The Filter button looks like a funnel.

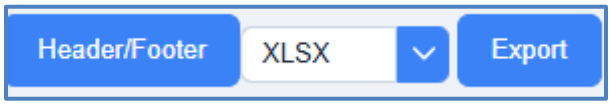

After clicking the Filter button, the user will be presented with a popup. Here, the user can select which values to view in the final export. For example, if the Export is to include only Work Order Status "Open," the user can select this one status. If the user wants all open Work Order Statuses, they must select not just "Open," but all Work Order Status Types of "Open," which may include "Parts Received," "Awaiting Parts," etc.

Multiple fields may be filtered. If the user is to reuse the same filters on subsequent exports, it is recommended they save their filters in a Macro (see above).

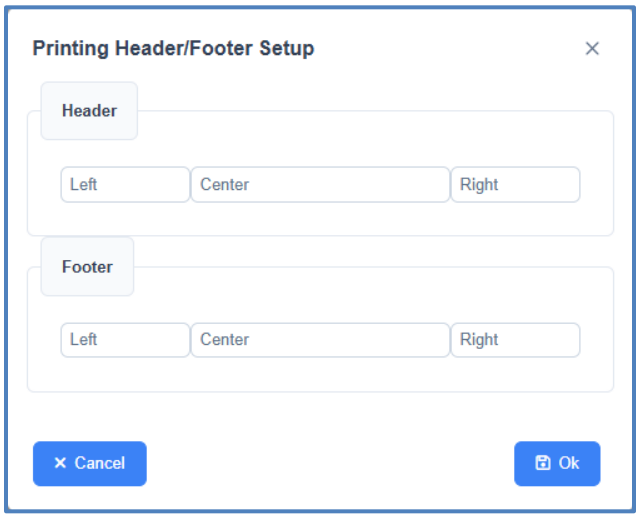

CLASSIFICATION: FOR PUBLIC USE

Footer

The footer section contains a button where the user can set a Header and Footer of the export, the ability to set the file type of the export, and the button to initiate the export.

Upon clicking the "Header/Footer" button, the user will be presented with a popup. In this popup, the user declares the values of the left, center, and right areas of both the Header and Footer. Not all areas must be used.

Next to the "Header/Footer" button is a dropdown that allows the user to declare the file type to be used. Currently, there are three types:

- CSV
- PDF
- XLSX

To the right of the file type selector is the Export button. Once the user selects the settings in the Header section, selects the needed fields, filters the data, and completes the Footer section, they may click the export button. Depending on the browser used, the file may be downloaded in different ways. On a Chromium-based browser, such as Chrome and Edge, the file will be displayed either in the lower-right or upper-left corner. If the browser is Internet Explorer, the user may be presented with a popup. Regardless of the browser, the download can be in the user's Downloads folder.

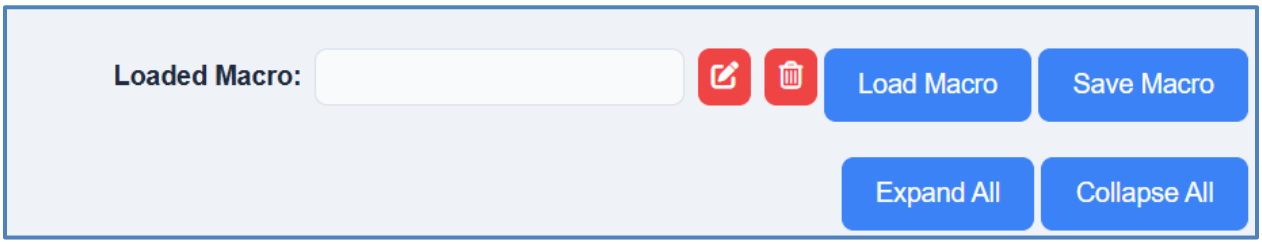

Note: Users will only be able to Export Data up to 50,000 Records.

CLASSIFICATION: FOR PUBLIC USE

Export Macros

Creating Macros

Export Macros work similarly to List View Macros. The Macro functionality is found in the upper right corner of the Export Screen and contains the same tools as the List View functionality.

1. Click in the dialog box and enter the name of the Macro. This box is also used as a dropdown to show other existing Macros. Ignore that functionality in the creation process.
2. Click the Save Macro button. This will open the "Save Macro" window.
    a. The "Global" checkbox (if active) will create the Macro for all Users.

Note: This functionality should be disabled for all non-Administrators! Otherwise, the list of Macros could become confusing.

    b. The "Macro Name" box shows what the name of the Macro will be and can be changed at this time.
    c. The Description box should be used to describe the purpose of the Macro and may include the parameters used.
    d. Click the OK button and the User will receive a toast message in the upper right corner stating the Macro has been saved.

Note: It is good practice to clear the filter from the Export by navigating away from the Export tool, navigating back, and testing the Macro.

Using Macros

1. The "Load Macro" icon allows Administrators to view Macros in their database.
2. Use the dropdown field to view the list of Macros available to the User and select the correct one.
3. The "View All" icon will allow Administrators to view all of the Macros available in their system.
4. Click "Load Macro"

Editing Macros

After the parameters have been corrected:

1. Use the edit icon on the right side of the page
2. This will allow users to edit the name and employees assigned to the Macro.

Deleting Macros

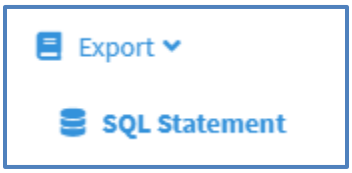

To delete a Macro:

1. Use the dropdown field to view the list of Macros available to the User and select the Macro to be deleted.
2. Click the red trashcan button to delete the Macro.

Note: This action cannot be undone!

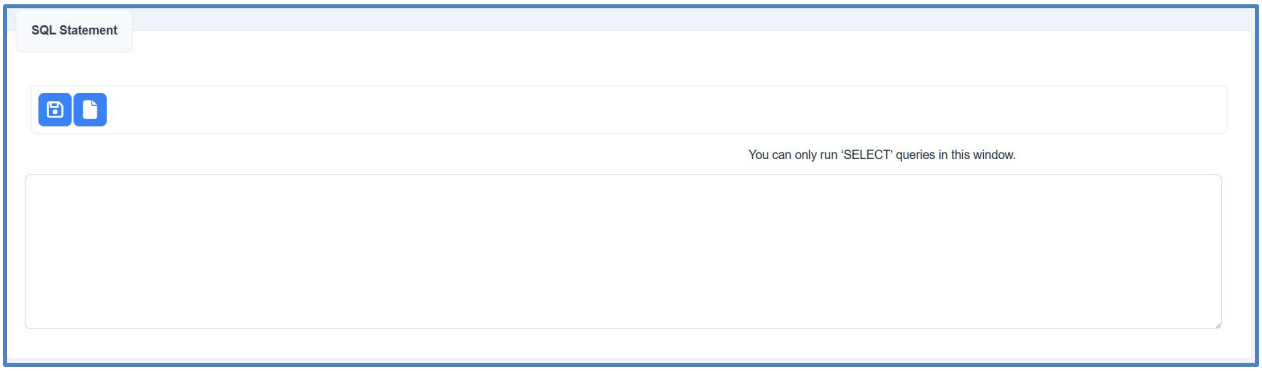

SQL Statement

The SQL Statement function is included for those users who are knowledgeable with SQL and would like to export their data using scripts. This allows advanced functionality where users can use:

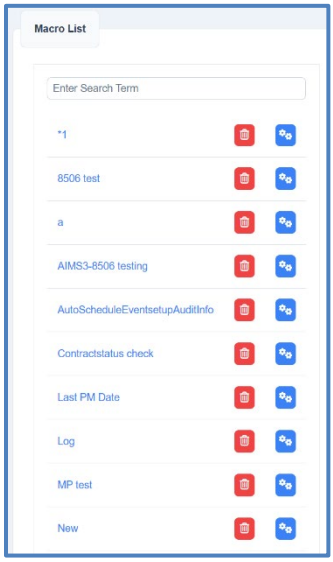

- Math functions, like SUM, AVG, and COUNT
- CASE statements
- Joins
- Grouping and Ordering

A box is provided for the user to insert or type their script. Once complete, the user may save the script as a Macro or Export the data using the buttons at the top.

Saved Macros are listed on the right side of the screen. The Macros include Edit and Delete buttons. The Edit button will allow users to edit which Facility the Macro is held in and determine which Security Level the Macro is saved to.

Note: SQL functions related to manipulating data has been disabled in the SQL Statement function. This includes, but is not limited to, insert, update, and delete.

Conclusion

The Export Component is a powerful tool to help users view their data outside of AIMS 3. The use of selecting fields and filtering data will be familiar to seasoned AIMS 3 users since they mimic the List View tools. In addition to the exported data, Export allows users to include totals, headers, and footers. For the advanced SQL user, AIMS 3 includes a SQL Statement function to retrieve data through scripts.

If Administrators require additional consulting or training, Phoenix Data Systems is available to assist at any level. Please contact our Sales Department or Project Managers for more information.

Appendix

To support your learning, we've created a How-To Guide in video format that walks you through each step visually. Simply click the link to be taken directly to our YouTube page, where you can watch the full set of tutorials at your own pace. This is a great way to follow along, revisit key actions, and get comfortable with the workflow.
