Overview

The Home Screen is a powerful tool that provides users with quick access to valuable information and daily activities within AIMS3. For Administrators and Managers, the Home Screen offers additional visibility in organizational data and team performance. Using the Facility and Employee filters, supervisors can easily view information for specific locations, employee groups, or individual employees. The Home Screen is also highly customizable, allowing users to add, remove, rearrange, and configure widgets to create a personalized workspace that best supports their responsibilities and workflow.

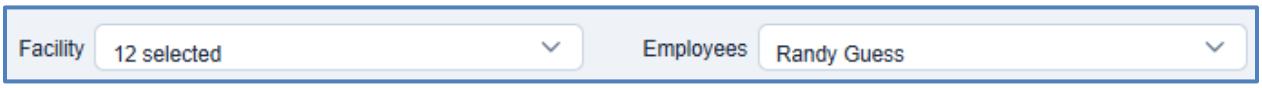

Upon logging into AIMS3, users are automatically directed to the Home Screen. If the Home Screen is empty, users can add widgets by using the Widget dropdown menu located at the bottom of the page. This menu displays all available widgets that can be added to the Home Screen. After selecting a widget, click the plus (+) icon to add it to your dashboard. The Adobe PDF button generates a PDF snapshot of the current Home Screen layout.

To remove all widgets from your Home Screen, click the Clear button. This will remove all widgets currently displayed on the Home Screen, allowing you to start with a blank layout.

The Assign Layout icon, identified by an arrow symbol, allows administrators and managers to assign a Home Screen layout to all users within a specific security level. This feature makes it easy to create a standardized dashboard with the most important widgets and distribute it to staff, ensuring users have quick access to the information most relevant to their roles.

All widgets displayed on the Home Screen are interactive and will update automatically based on the filters selected at the top of the page or when users drill down into other widgets. For example, selecting one or more facilities in the Facility filter will update the widgets to display information only for the selected facilities. Likewise, using the Employee filter will limit the displayed data to the selected employees. This allows users and managers to quickly focus on specific locations, teams, or individuals without leaving the Home Screen.

Common Tools

All widgets that display a list of records include two common tools: Export and Pop-Out View.

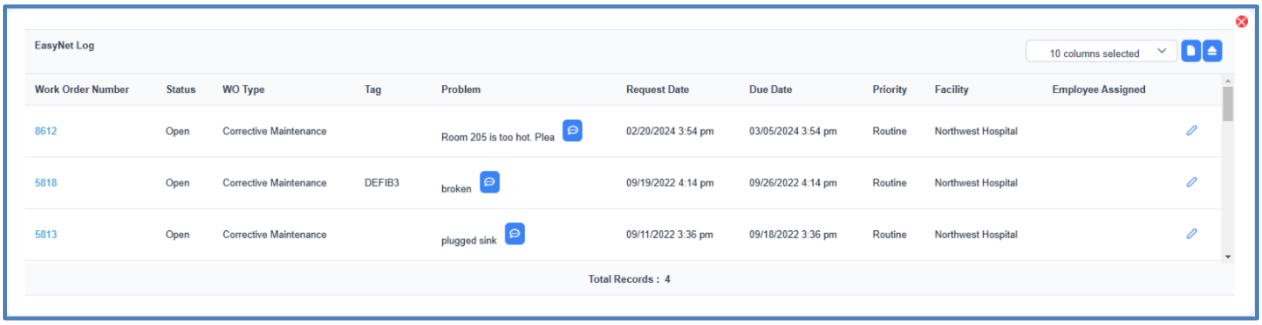

The Export button allows users to export the contents of the list to an Excel spreadsheet for additional analysis, reporting, or record keeping. The Pop-Out View button expands the list into a larger window and provides additional functionality when available. For work order lists, users can assign multiple work orders at the same time instead of assigning them individually. The Pop-Out View also allows users to navigate through work orders while keeping the selected work order displayed on the main screen for easier review.

Work order widgets also include a Column Selector field. This dropdown allows users to choose which columns are displayed in the list. Columns will appear in the order they are selected, allowing users to customize the layout to meet their needs. These column selections are user-specific and cannot be applied globally to other users.

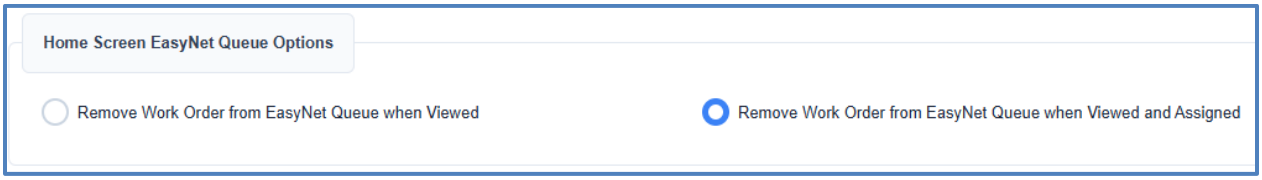

To open a work order from any widget, simply click the Work Order Number. The selected work order will open directly on its corresponding record screen.

EasyNet Log

The EasyNet Queue widget displays all work orders submitted through EasyNet, with the most recently submitted work orders appearing at the top of the list. This allows users to quickly monitor incoming requests and review the latest activity submitted through the EasyNet portal.

By default, work orders are removed from the EasyNet Queue after they have been viewed. However, this behavior can be changed in EasyNet > EasyNet Setup > Other Settings. When enabled, work orders will remain in the queue until they have been both viewed and assigned, allowing users additional time to review and manage incoming requests before they are removed from the list.

Employee Daily Productivity

The Productivity widget displays productivity statistics for the current user or selected employees for the current day. This widget helps managers and staff quickly monitor workload, productivity, and completed work activity.

The columns displayed in the widget include:

- **Estimated Hours** – The total estimated hours from all work orders that were updated or closed.
- **Total Hours** – The total number of hours worked, including both work order and administrative activities.
- **PM Hours** – The total hours logged against Preventive Maintenance (PM) work orders.
- **Non-PM Hours** – The total hours logged against non-preventive maintenance work orders.
- **Admin Hours** – The total hours recorded for administrative activities entered through the User menu.
- **WOs Updated** – The total number of work orders that were updated or closed.
- **PMs Completed** – The number of Preventive Maintenance work orders completed.
- **Non-PMs Completed** – The number of non-preventive maintenance work orders completed.
- **Total Completed** – The total number of work orders completed, including both PM and non-PM work orders.

This widget provides a quick snapshot of daily productivity and can be filtered by facility or employees to analyze performance across various locations, teams, or individuals.

Employee Weekly Productivity

The Weekly Productivity widget displays productivity statistics for the current user or selected employees for the current week. This widget provides a summary of hours worked, work orders updated, and work orders completed, making it a useful tool for monitoring individual and team performance throughout the week.

The columns displayed in the widget include:

- **Estimated Hours** – The total estimated hours from all work orders that were updated or closed.
- **Total Hours** – The total number of hours worked, including both work order and administrative activities.
- **PM Hours** – The total hours logged against Preventive Maintenance (PM) work orders.
- **Non-PM Hours** – The total hours logged against non-preventive maintenance work orders.
- **Admin Hours** – The total hours recorded for administrative activities entered through the User menu.
- **WOs Updated** – The total number of work orders that were updated or closed.
- **PMs Completed** – The number of Preventive Maintenance work orders completed.
- **Non-PMs Completed** – The number of non-preventive maintenance work orders completed.
- **Total Completed** – The total number of work orders completed, including both PM and non-PM work orders.

Clicking the arrow next to an employee's name will expand the record and display productivity details for each day of the current week. This widget automatically resets at the beginning of each week on Sunday, providing a fresh view of weekly productivity data.

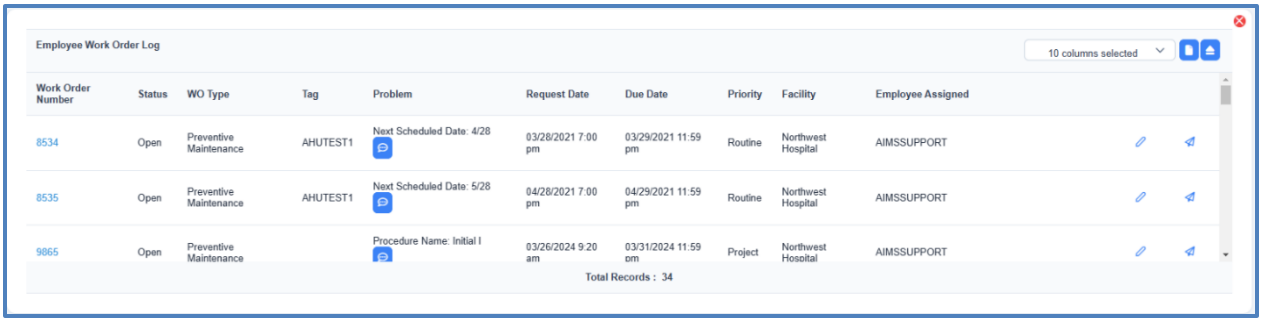

Employee Work Order Log

The Employee Work Order Log displays all open work orders assigned to the current user and any selected employees. This widget is interactive and can be affected by data selected in other Home Screen widgets.

For example, if a user clicks on a priority level in the Open Work Orders by Priority widget, the Employee Work Order Log will automatically update to display only the work orders associated with that selected priority. This allows users to quickly drill down into specific groups of work orders for further review.

To return the widget to its default view and remove any applied filters, click the Clear Filter button located on the right side of the widget header. This will restore the full list of open work orders based on the current Home Screen filters.

Note: If the Employee Work Order Log shows no data, always review and clear the filters.

Note: Users can determine if the Employee Work Order Log is filtered due to the pink striped header at the top of the widget.

A Column Selector is in the upper-right corner of the widget and allows users to choose which columns are displayed in the Employee Work Order Log. This helps users customize the list to show the information most relevant to their needs. While a pencil icon appears next to each work order, it is only used to update the Employee Assigned field.

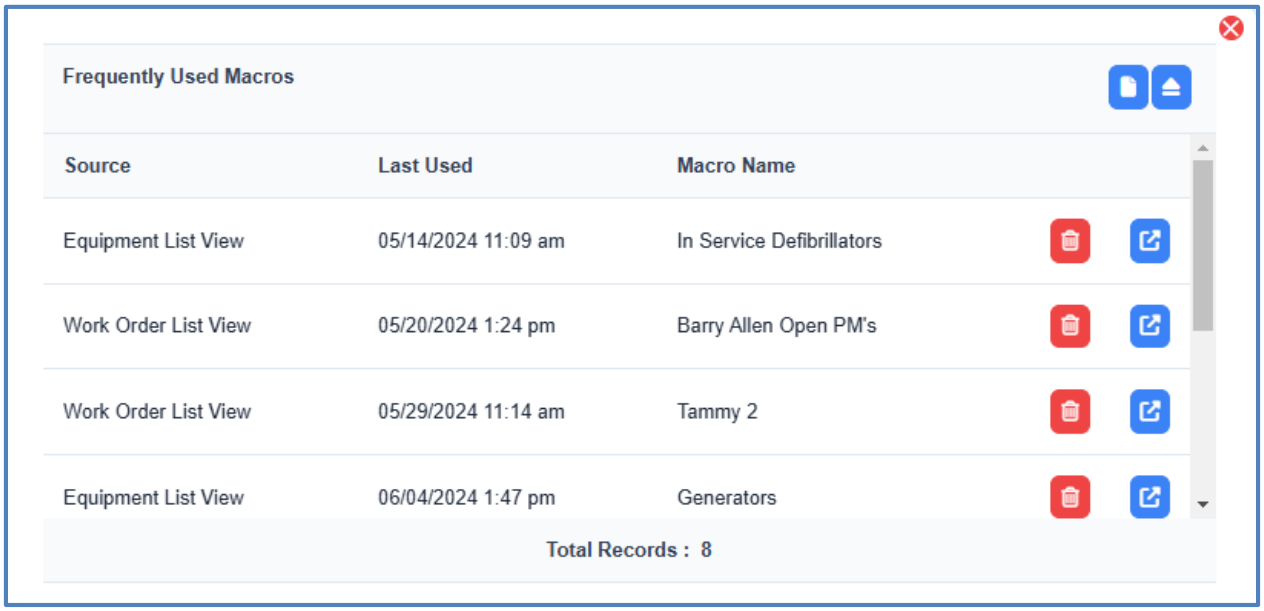

To export the Employee Work Order Log, click the Export button located next to the Clear Filter button. This will export the current list to an Excel spreadsheet. Clicking the Pop-Out View button opens the Employee Work Order Log in a separate window, providing a larger workspace for reviewing and managing work orders.

Frequently Used Macros

The Frequently Used Macros widget displays the macros you access most often. Macros saved through a List View, Export Tool, or SQL Statement Tool can appear in this widget. Clicking the Go To button next to a macro will open the associated results screen, allowing users to quickly access filtered data without having to display it directly on the Home Screen.

This widget provides a convenient way to access commonly used searches, reports, and exports with a single click, improving efficiency and reducing the need to repeatedly configure filters.

Clicking the Delete button next to a Macro only removes it from the Frequently Used Macros widget and does not delete the Macro itself. The macro will remain available in its original component and can be added back to the widget by using it again.

Note: This list only holds the top ten records!

Open Non-PM Work Orders by Priority

The Open Work Orders by Priority widget displays the number of open work orders grouped by priority level. This provides users and managers with a quick overview of workload distribution and helps identify high-priority work that may require immediate attention.

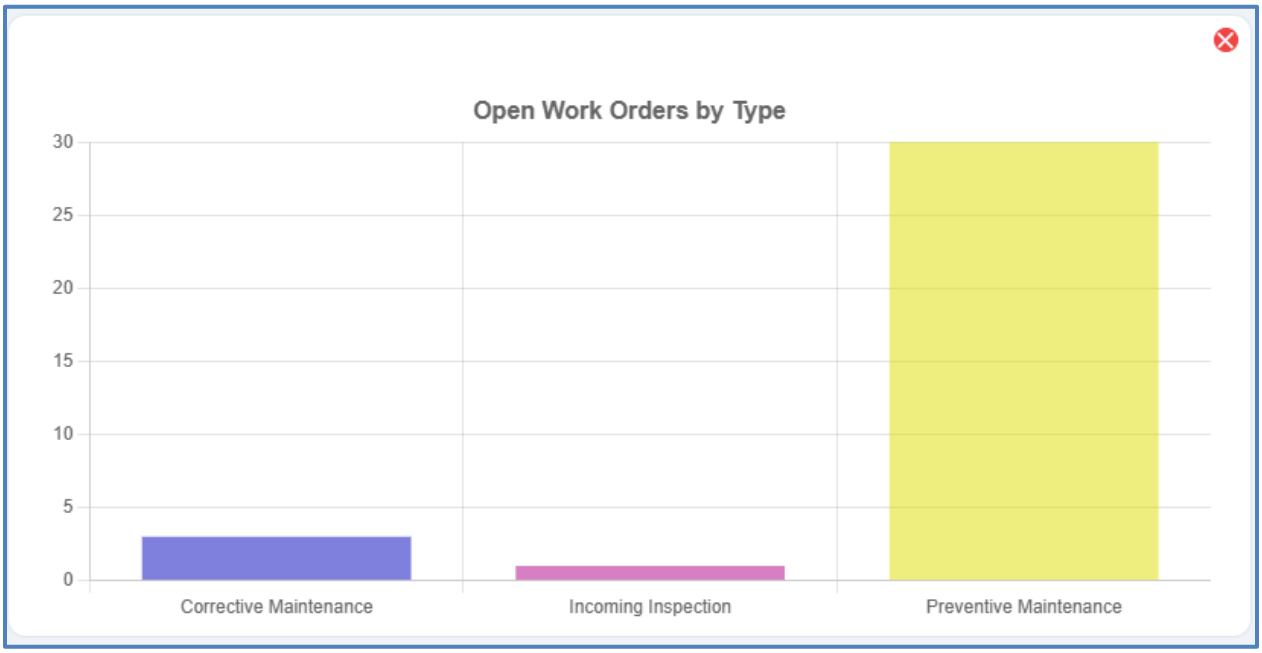

The widget is interactive and works with other Home Screen widgets. Clicking a priority level within the graph will automatically filter the Employee Work Order Log widget to display only work orders with the selected priority. This allows users to quickly drill down into specific groups of work orders for review and follow-up.

Open Work Orders by Type

The Open Work Orders by Type widget display the number of open work orders grouped by Work Order Type. This provides users with a quick overview of the types of work being performed and helps identify workload distribution across various categories.

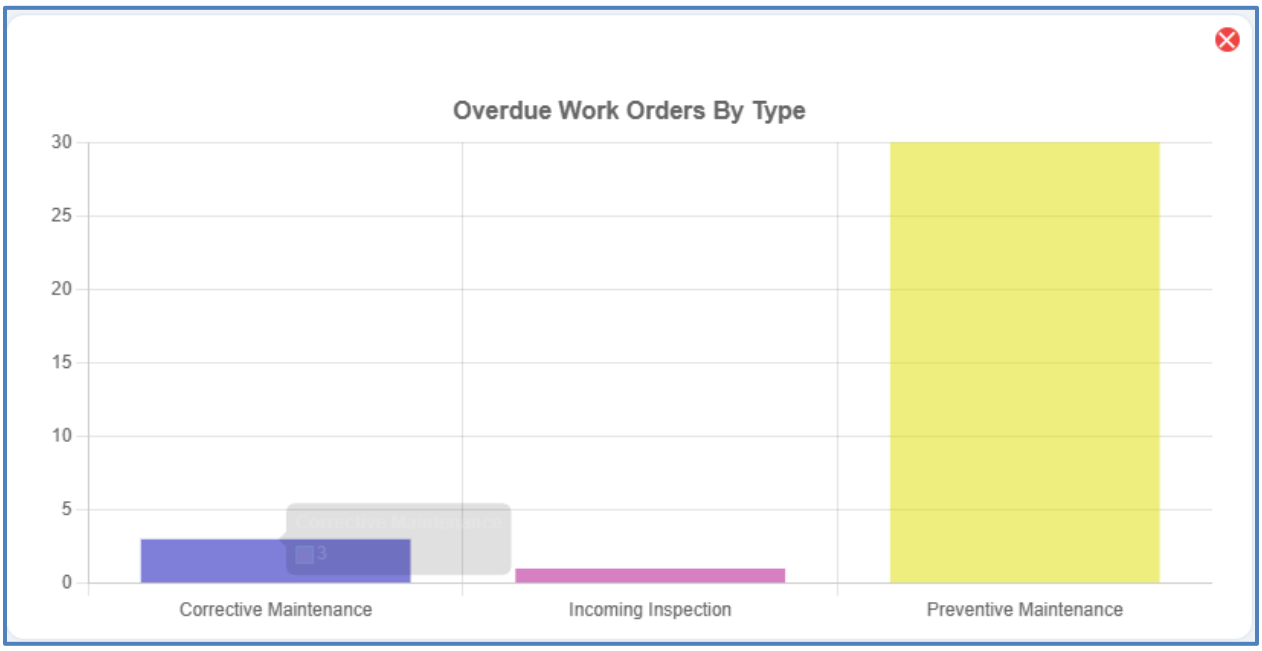

The widget is interactive and can be used to filter other Home Screen widgets. Clicking on a specific Work Order Type within the graph will automatically update the Employee Work Order Log to display only work orders of that selected type. This is especially useful when users want to focus on a particular category of work orders without manually applying filters.

Overdue Work Orders by Type

The Overdue Work Orders by Type widget displays the number of overdue work orders grouped by Work Order Type. This provides users and managers with a quick overview of overdue work and helps identify areas that may require immediate attention.

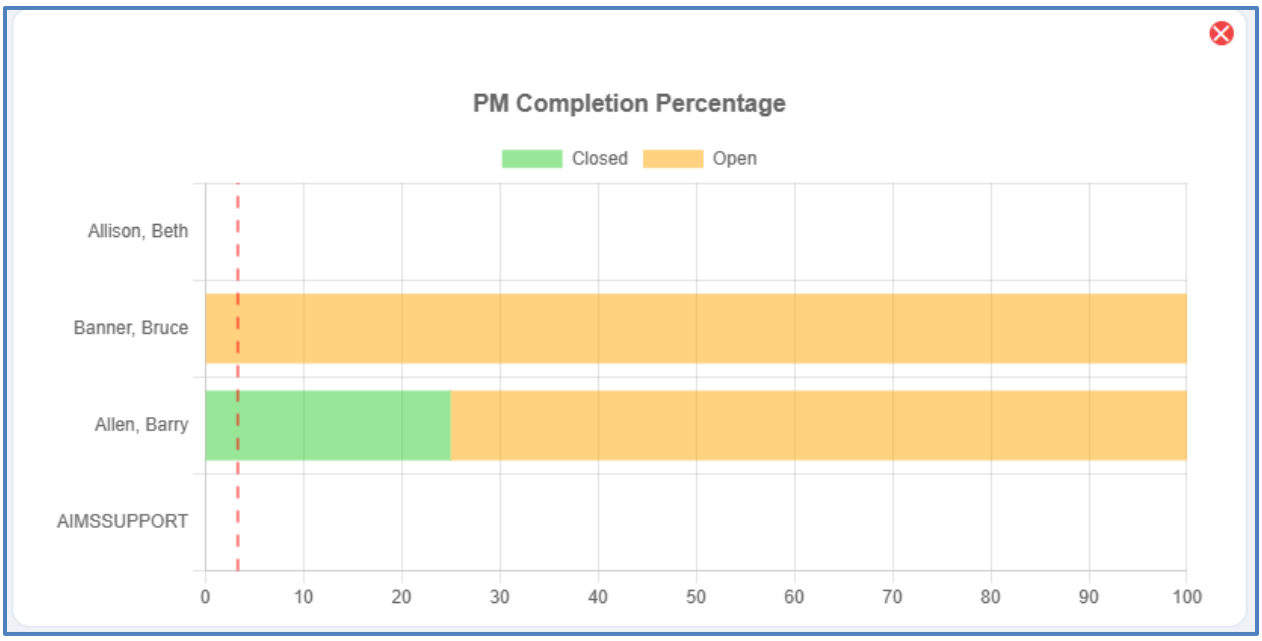

The widget is interactive and integrates with other Home Screen widgets. Clicking on a specific Work Order Type within the graph will automatically update the Employee Work Order Log to display only the overdue work orders associated with that selected type. This allows users to quickly drill down into specific categories of overdue work orders and manage them more effectively.

PM Completion Percentage

The PM Completion Percentage widget helps users track their Preventive Maintenance workload and monitor completion progress throughout the current month. The widget visually displays the percentage of PM work orders that have been completed versus those that remain open.

The green portion of the chart represents completed PM work orders, while the orange portion represents active or outstanding PM work orders. As the month progresses, a red dotted line moves across the widget to indicate the percentage of the month that has elapsed. This allows users and managers to quickly compare PM completion progress against the amount of time remaining in the month and determine whether PM activities are on track to be completed by month-end.

Note: This graph is “read-only”

Pending Purchase Order Approvals

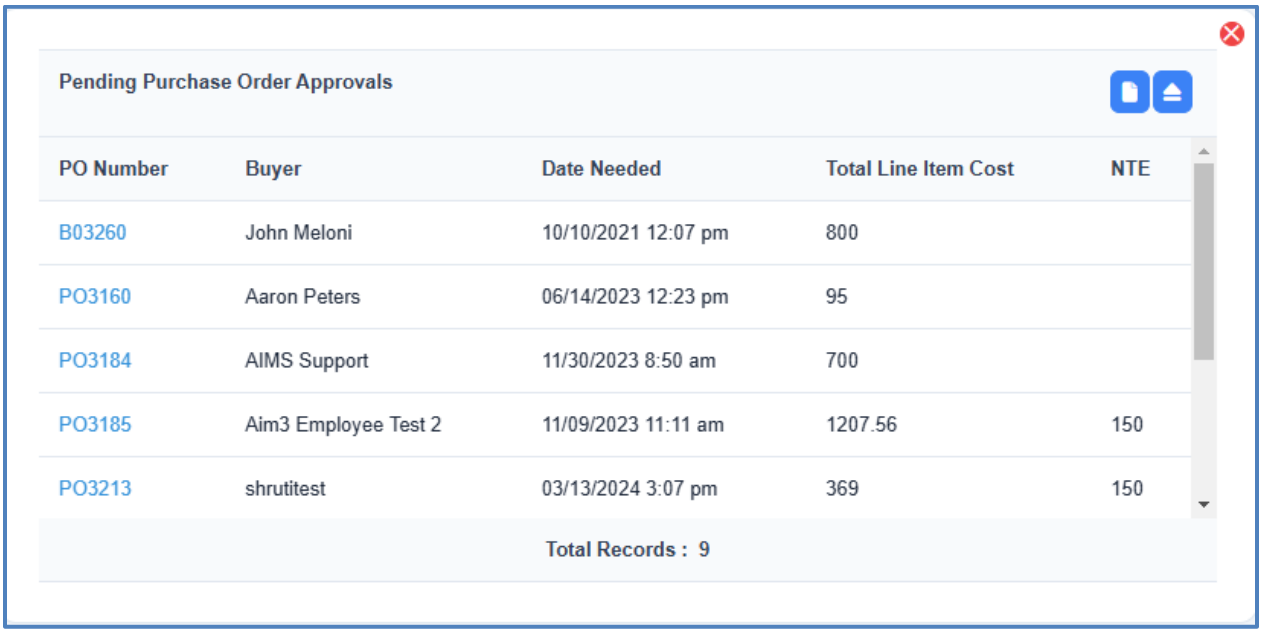

The Pending Purchase Order Approval widget displays all Purchase Orders that require approval before they can be processed and ordered. This widget provides approvers with a quick view of pending requests, helping ensure purchase orders are reviewed and approved in a timely manner.

The information displayed includes:

- **PO Number** – The unique Purchase Order number.
- **Buyer** – The user who submitted the purchase request.
- **Date Needed** – The date by which the requested items are needed.
- **Total Line-Item Cost** – The total cost of all line items on the Purchase Order.
- **Not to Exceed Value** – The maximum approved amount for the Purchase Order.

Once a Purchase Order has been approved, it is automatically removed from the widget and will no longer appear in the list of pending approvals. This helps users focus only on Purchase Orders that still require action.

Note: The only users who will see this widget are those who are declared "Purchase Order Approver!"

Pending Purchase Request Approvals

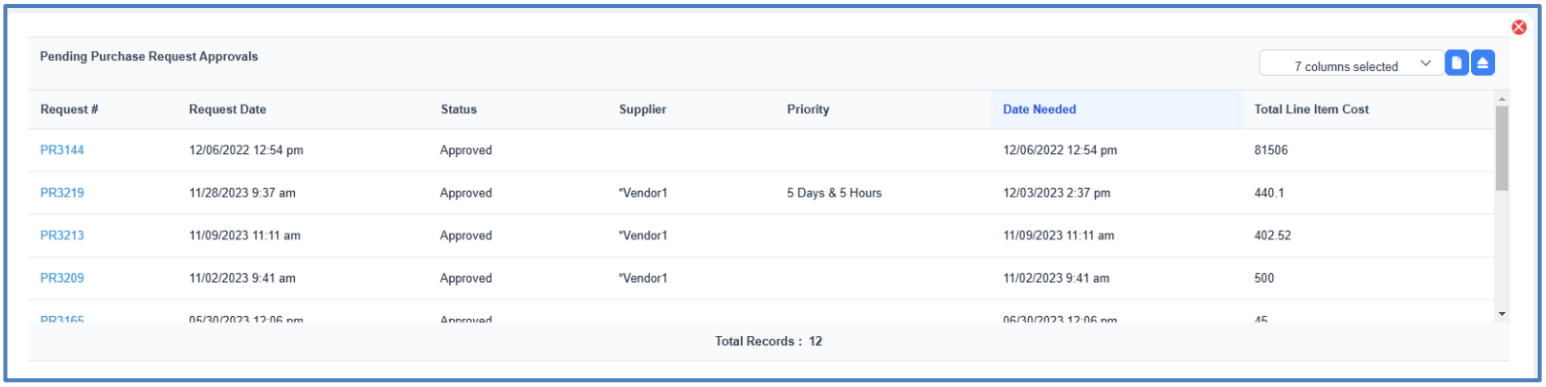

The Pending Purchase Approval widget displays all purchase requests that have been approved by Administration and are awaiting further processing. This widget provides users with a quick overview of approved purchase requests and their status.

The information displayed includes:

- **Request #** – The unique purchase request number.
- **Request Date** – The date the request was submitted.
- **Status** – The status of the purchase request.
- **Supplier** – The selected supplier or vendor.
- **Priority** – The priority assigned to the request.
- **Date Needed** – The date by which the requested items are needed.
- **Total Line-Item Cost** – The total cost of all items included in the request.

The widget also includes a Column Selector, which allows users to customize the information displayed. Users can add additional columns or remove columns they do not wish to see, creating a view that best suits their needs. These column selections are user-specific and can be adjusted at any time.

Note: The only users who will see this widget are those who are declared "Purchase Request Approver!"

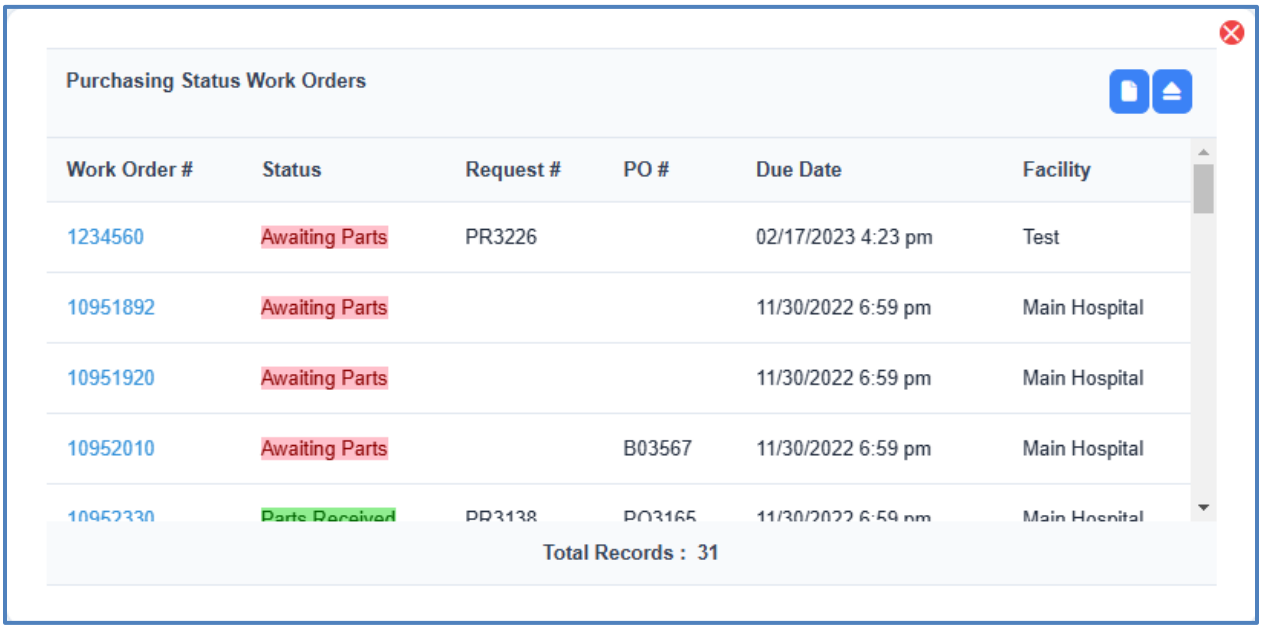

Purchasing Status Work Orders

The Purchasing Status Work Orders widget displays work orders that are waiting on parts and groups them by purchasing status. Statuses are color-coded to help users quickly identify the current state of each work order:

- **Parts Received** – Green
- **Some Parts Received** – Yellow
- **Awaiting Parts** – Red

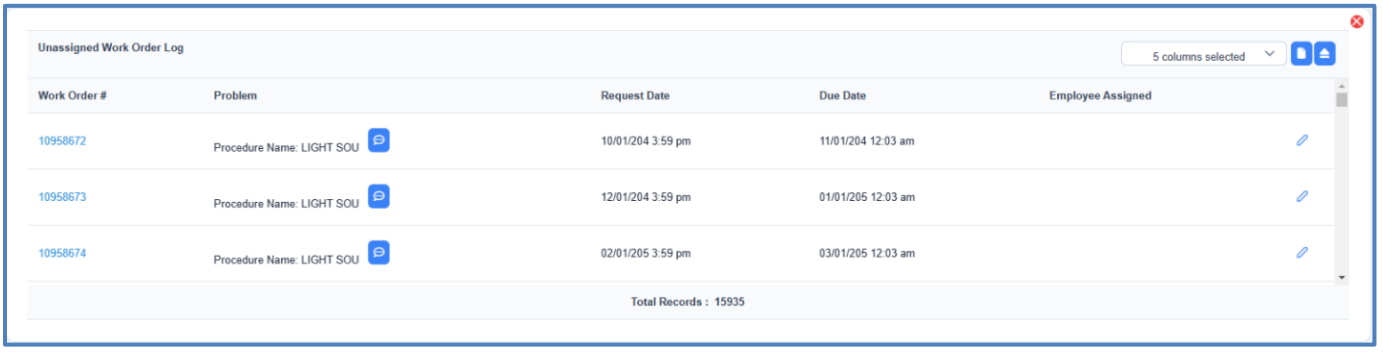

Work orders are organized by status, allowing users to easily monitor purchasing progress and identify delays caused by outstanding parts orders.

Unassigned Work Order Log

The Unassigned Work Order Log widget displays all open work orders that do not currently have an employee assigned. This allows supervisors and managers to quickly identify work that still needs to be distributed and ensures new requests do not go unnoticed.

Like the Employee Work Order Log, users can assign work orders directly from the widget. The widget also supports the Pop-Out View feature, which opens the list in a separate window and provides additional functionality. Using the Pop-Out View, users can assign multiple work orders to the same employee at one time, making it easier to manage workloads and improve scheduling efficiency.

Conclusion

The Home Screen is a powerful and customizable dashboard that provides users with quick access to valuable information, work activities, and performance metrics within AIMS3. Employees can use the Home Screen to monitor daily tasks and workload, while Administrators and Managers can leverage additional tools and filters to gain visibility into team and organizational performance.

Using the Facility and Employee filters, managers can quickly drill down into specific locations, teams, or individual employees to review productivity, work order activity, purchasing information, and other key metrics. The Home Screen can be personalized by adding, removing, rearranging, and configuring widgets to best support each user's role and responsibilities.

When configured effectively, the Home Screen serves as a central hub for monitoring operations, tracking performance, and accessing critical information throughout the day. Its flexibility allows organizations to create tailored dashboards that improve visibility, efficiency, and decision-making across all levels of the organization.

If your organization would like additional assistance with Home Screen configuration, customization, or best practices, Phoenix Data Systems is available to provide consulting and training services. Please contact your Project Manager or the Phoenix Data Systems Sales Team for more information.

Appendix

To support your learning, we have created a step-by-step video guide that visually walks you through the entire process.
